**BENZIMIDAZOLE DERIVATIVES
AND COMBINATORIAL LIBRARIES THEREOF**

BACKGROUND OF THE INVENTION

FIELD OF THE INVENTION

5 The present invention relates generally to the synthesis of compounds comprising heterocyclic rings. In one specific embodiment, the invention provides novel benzimidazole derivative compounds as well as novel combinatorial libraries comprised of such compounds.

10 BACKGROUND INFORMATION

The process of discovering new therapeutically active compounds for a given indication involves the screening of all compounds from available compound collections. From the compounds tested, one or more structures is selected as a promising lead. A large number of related analogs are then synthesized in order to develop a structure-activity relationship and select one or more optimal compounds. With traditional "one-at-a-time" synthesis and biological testing of analogs, this optimization process is long and labor intensive. Adding significant numbers of new structures to the compound collections used in the initial screening step of the discovery and optimization process cannot be accomplished with traditional "one-at-a-time" synthesis methods, except over a time frame of years or even decades.

Faster methods are needed that allow for the preparation of up to thousands of related compounds in a matter of days or a few weeks. This need is particularly evident when it comes to synthesizing more complex compounds, such as benzimidazole derivative compounds.

Combinatorial approaches have recently been extended to "organic," or non-peptide, libraries. For example, Zambias et al. (U.S. Patent No. 5,712,171) describe a method of generating libraries that contain 5 aminimides, oxazolones, sulfonylaminides and phosphonylaminides as the core structure in spatially arranged arrays. Combinatorial chemical methods have been applied to a limited number of heterocyclic compounds, as described, for example, in Wilson et al., 10 *Molecular Diversity*, 3:95-112 (1998); U.S. Patent Nos. 5,288,514; 5,324,483; and Goff et al., *J. Org. Chem.*, 60:5748-5749 (1995). See also U.S. Patent Nos. 5,549,974 and 5,506,337.

Combinatorial chemical methods have even been 15 extended to benzimidazole compounds, as described, for example, in Tumelty et al., *Tetrahedron Lett.*, 40:6185-6188 (1999); Yeh et al., *Synlett*, 6:810-812 (1999); Sun et al., *Bioorg. & Med. Chem. Ltrs.*, 8:361-364 (1998); Huang et al., *Tetrahedron Lett.*, 40:2665-2668 (1999); 20 Phillips and Wei, *Tetrahedron Lett.*, 37:4887-4890 (1996); and Mayer et al., *Tetrahedron Lett.*, 39:6655-6658 (1998). However, the heterocyclic libraries to date contain compounds of limited diversity and complexity, especially at either of the ring nitrogen positions.

25 Substituent limitations have been overcome for mixtures of peptides and peptidomimetics through the use of solid phase techniques versus solution-phase. An important step in the development of solid-phase techniques was the discovery of methods to prepare large 30 numbers of individual compounds simultaneously, as described, for example, by Houghten in U.S. Patent No. 4,631,211. These solid phase methods, however, have rarely been applied to the syntheses of complex

heterocyclic structures. Therefore a need exists to develop more complex "organic" libraries based on heterocyclic medicinal compounds which would need less time and effort in the synthesis and testing required to 5 bring an organic pharmaceutical product to fruition. In short, improved methods for generating therapeutically useful heterocyclic compounds, such as benzimidazole derivatives, are desired.

Benzimidazole derivative compounds have been 10 the subject of investigation in a number of different biological areas. For example, benzimidazole derivatives have been used extensively as antihistamines, antiulceratives and against viruses (see Mayer et al., *supra* and Yeh et al., *supra*) Benzimidazole derivatives 15 have also been the subject of serial chemical synthesis. See, for example, Yukawa, et al., *Bioorg. Med. Chem. Lett.*, 7:1267 (1997); Thomas et al., *Tetrahedron Lett.*, 38:5099 (1997); Rakitin et al., *Tetrahedron Lett.*, 37:4589 (1996); Ries et al., *J. Med. Chem.*, 36:4040 20 (1993); Corroll, et al., *J. Med. Chem.*, 18:318 (1975); Wright, J.B., *J. Am. Chem. Soc.*, 71:2035 (1949); and Mokee et al., *J. Am. Chem. Soc.*, 68:1904 (1946). 25 However, more complex benzimidazole derivatives, especially those substituted at one of the ring nitrogen positions have been difficult to attain.

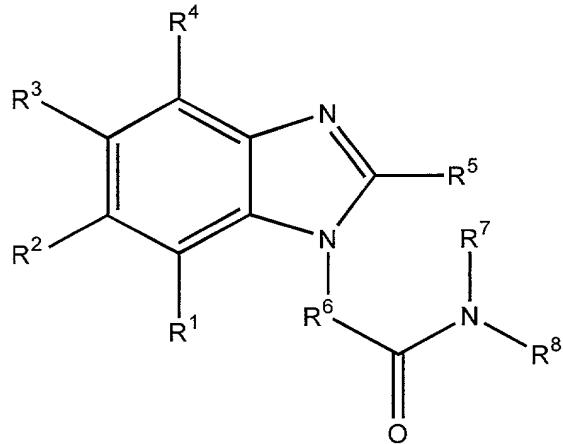

This invention satisfies this need and provides related advantages as well. The present invention overcomes the known limitations to classical serial organic synthesis of benzimidazole derivatives, for 30 example, as well as the shortcomings of combinatorial chemistry related to benzimidazole derivatives. The present invention allows for rapid generation of large diverse libraries of complex benzimidazole derivatives as

discrete molecules. The present invention can utilize a readily available pool of building blocks that can be incorporated into the various regions of the molecule. Furthermore, the method of making the present invention 5 allows for the use of building blocks that contain a wide range of diverse functionality. Such building blocks can provide combinatorial libraries that consist of large numbers as well as combinatorial libraries that are extremely diverse with respect to the functionality 10 contained within those libraries. The present invention combines the techniques of solid-phase synthesis of benzimidazole derivatives and the general techniques of synthesis of combinatorial libraries to prepare highly diverse new benzimidazole derivative compounds.

The invention also provides methods for making benzimidazole derivative compounds and libraries. In one method of the invention, benzimidazole derivative compounds can be prepared by:

- 5 (a) coupling a first compound having a substituent of the formula $-\text{NH}-\text{C}(\text{O})-\text{variable group}-\text{NH}_2$ with a phenyl compound that is substituted with a nitro group and a halo group in an ortho relationship on the phenyl ring, the phenyl compound optionally substituted with a variable group at
- 10 one or more of the remaining 4 positions of the phenyl ring, resulting in a phenyl compound substituted with a nitro group and an ortho monosubstituted amino group;
- 15 (b) reducing the nitro group of the phenyl compound resulting from step (a); and
- 20 (c) coupling the compound resulting from step (b) with an aldehyde of the formula variable group-CHO, resulting in a benzimidazole derivative compound.

In another method of the invention, the first compound having a substituent of the formula $-\text{NH}-\text{C}(\text{O})-\text{variable group}-\text{NH}_2$ is attached to solid support.

In a further method of the invention, the variable group on the phenyl group in step (a) is a carboxyl.

An additional method of the invention provides

25 that the carboxyl group of the phenyl compound resulting from step (a) is coupled with a monosubstituted amine compound, a disubstituted amine compound, a cyclic imino

compound or an alcohol, resulting, respectively, in (I) a monosubstituted carboxamido substituent attached to the phenyl compound; (ii) a disubstituted substituent carboxamido attached to the phenyl compound; (iii) a 5 cyclic imino carbonyl substituent attached to the phenyl compound; or (iv) an ester substituent attached to the phenyl compound.

The term "phenylene" means a phenyl group where 15 the phenyl radical is bonded at two positions connecting together two separate additional groups. Examples of "phenylene" include 1,2-phenylene, 1,3-phenylene, and 1,4-phenylene.

The term "substituted phenylene" means a phenyl 20 group where the phenyl radical is bonded at two positions connecting together two separate additional groups, wherein the phenyl is substituted as described above in relation to "substituted phenyl."

25 The term "substituted C₁ to C₁₂ alkylene" means a C₁ to C₁₂ alkyl group where the alkyl radical is bonded at two positions connecting together two separate additional groups and further bearing an additional substituent. Examples of "substituted C₁ to C₁₂ alkylene"

The terms "cyclic C₂ to C₇ alkylene,"

5 "substituted cyclic C₂ to C₇ alkylene," "cyclic C₂ to C₇ heteroalkylene," and "substituted cyclic C₂ to C₇ heteroalkylene," defines such a cyclic group bonded ("fused") to the phenyl radical resulting in a bicyclic ring system. The cyclic group may be saturated or
 10 contain one or two double bonds. Furthermore, the cyclic group may have one or two methylene or methine groups replaced by one or two oxygen, nitrogen or sulfur atoms which are the cyclic C₂ to C₇ heteroalkylene.

The cyclic alkylene or heteroalkylene group may

15 be substituted once or twice by the same or different substituents which, if appropriate, can be connected to another part of the compound (e.g., alkylene) selected from the group consisting of the following moieties: hydroxy, protected hydroxy, carboxy, protected carboxy,
 20 oxo, protected oxo, C₁ to C₄ acyloxy, formyl, C₁ to C₁₂ acyl, C₁ to C₁₂ alkyl, C₁ to C₇ alkoxy, C₁ to C₁₀ alkylthio, C₁ to C₁₀ alkylsulfoxide, C₁ to C₁₀ alkylsulfonyl, halo, amino, protected amino, (monosubstituted)amino, protected (monosubstituted)amino, (disubstituted)amino,
 25 hydroxymethyl or a protected hydroxymethyl.

The cyclic alkylene or heteroalkylene group fused onto the benzene radical can contain two to ten ring members, but it preferably contains three to six members. Examples of such saturated cyclic groups are
 30 when the resultant bicyclic ring system is 2,3-dihydro-indanyl and a tetralin ring. When the cyclic groups are

unsaturated, examples occur when the resultant bicyclic ring system is a naphthyl ring or indolyl. Examples of fused cyclic groups which each contain one nitrogen atom and one or more double bond, preferably one or two double bonds, are when the benzene radical is fused to a pyridino, pyrano, pyrrolo, pyridinyl, dihydropyrrolo, or dihydropyridinyl ring. Examples of fused cyclic groups which each contain one oxygen atom and one or two double bonds are when the benzene radical ring is fused to a furo, pyrano, dihydrofuran, or dihydropyrano ring.

Examples of fused cyclic groups which each have one sulfur atom and contain one or two double bonds are when the benzene radical is fused to a thieno, thiopyrano, dihydrothieno or dihydrothiopyrano ring. Examples of cyclic groups which contain two heteroatoms selected from sulfur and nitrogen and one or two double bonds are when the benzene radical ring is fused to a thiazolo, isothiazolo, dihydrothiazolo or dihydroisothiazolo ring.

Examples of cyclic groups which contain two heteroatoms selected from oxygen and nitrogen and one or two double bonds are when the benzene ring is fused to an oxazolo, isoxazolo, dihydrooxazolo or dihydroisoxazolo ring.

Examples of cyclic groups which contain two nitrogen heteroatoms and one or two double bonds occur when the benzene ring is fused to a pyrazolo, imidazolo, dihydropyrazolo or dihydroimidazolo ring or pyrazinyl.

The term "carbamoyl" means an -NCO- group where the radical is bonded at two positions connecting two separate additional groups.

One or more of the compounds of the invention, even within a given library, may be present as a salt. The term "salt" encompasses those salts that form with

the carboxylate anions and amine nitrogens and include salts formed with the organic and inorganic anions and cations discussed below. Furthermore, the term includes salts that form by standard acid-base reactions with 5 basic groups (such as amino groups) and organic or inorganic acids. Such acids include hydrochloric, hydrofluoric, trifluoroacetic, sulfuric, phosphoric, acetic, succinic, citric, lactic, maleic, fumaric, palmitic, cholic, pamoic, mucic, D-glutamic, D-camphoric, 10 glutaric, phthalic, tartaric, lauric, stearic, salicyclic, methanesulfonic, benzenesulfonic, sorbic, picric, benzoic, cinnamic, and like acids.

The term "organic or inorganic cation" refers to counter-ions for the carboxylate anion of a 15 carboxylate salt. The counter-ions are chosen from the alkali and alkaline earth metals, (such as lithium, sodium, potassium, barium, aluminum and calcium); ammonium and mono-, di- and tri-alkyl amines such as trimethylamine, cyclohexylamine; and the organic cations, 20 such as dibenzylammonium, benzylammonium, 2-hydroxyethylammonium, bis(2-hydroxyethyl)ammonium, phenylethylbenzylammonium, dibenzylethylenediammonium, and like cations. See, for example, "Pharmaceutical Salts," Berge et al., J. Pharm. Sci., 66:1-19 (1977), 25 which is incorporated herein by reference. Other cations encompassed by the above term include the protonated form of procaine, quinine and N-methylglucosamine, and the protonated forms of basic amino acids such as glycine, ornithine, histidine, phenylglycine, lysine and arginine. 30 Furthermore, any zwitterionic form of the instant compounds formed by a carboxylic acid and an amino group is referred to by this term. For example, a cation for a carboxylate anion will exist when a position is

substituted with a (quaternary ammonium)methyl group. A preferred cation for the carboxylate anion is the sodium cation.

The compounds of the invention can also exist 5 as solvates and hydrates. Thus, these compounds may crystallize with, for example, waters of hydration, or one, a number of, or any fraction thereof of molecules of the mother liquor solvent. The solvates and hydrates of such compounds are included within the scope of this 10 invention.

One or more compounds of the invention, even when in a library, can be in the biologically active ester form, such as the non-toxic, metabolically-labile ester-form. Such ester forms induce increased blood 15 levels and prolong the efficacy of the corresponding non-esterified forms of the compounds. Ester groups which can be used include the lower alkoxyethyl groups, for example, methoxymethyl, ethoxymethyl, isopropoxymethyl and the like; the -(C₁ to C₁₂) alkoxyethyl groups, for 20 example methoxyethyl, ethoxyethyl, propoxyethyl, isopropoxyethyl and the like; the 2-oxo-1,3-dioxolen-4-ylmethyl groups, such as 5-methyl-2-oxo-1,3-dioxolen-4-ylmethyl, 5-phenyl-2-oxo-1,3-dioxolen-4-ylmethyl and the like; the C₁ to C₁₀ alkylthiomethyl groups, for example 25 methylthiomethyl, ethylthiomethyl, iso-propylthiomethyl and the like; the acyloxymethyl groups, for example pivaloyloxymethyl, pivaloyloxyethyl, -acetoxyethyl and the like; the ethoxycarbonyl-1-methyl group; the -acetoxyethyl; the 1-(C₁ to C₁₂) alkyloxycarbonyloxyethyl 30 groups such as the 1-(ethoxycarbonyloxy)ethyl group; and the 1-(C₁ to C₁₂) alkylaminocarbonyloxyethyl groups such as the 1-(methylaminocarbonyloxy)ethyl group.

The term "amino acid" includes any one of the twenty naturally-occurring amino acids or the D-form of any one of the naturally-occurring amino acids. In addition, the term "amino acid" also includes other non-5 naturally occurring amino acids besides the D-amino acids, which are functional equivalents of the naturally- occurring amino acids. Such non-naturally-occurring amino acids include, for example, norleucine ("Nle"), norvaline ("Nva"), L- or D- naphthalanine, ornithine 10 ("Orn"), homoarginine (homoArg) and others well known in the peptide art, such as those described in M. Bodanzsky, "Principles of Peptide Synthesis," 1st and 2nd revised ed., Springer-Verlag, New York, NY, 1984 and 1993, and Stewart and Young, "Solid Phase Peptide Synthesis," 2nd 15 ed., Pierce Chemical Co., Rockford, IL, 1984, both of which are incorporated herein by reference. Amino acids and amino acid analogs can be purchased commercially (Sigma Chemical Co.; Advanced Chemtech) or synthesized using methods known in the art.

20 The term "functionalized resin" means any resin, crosslinked or otherwise, where functional groups have been introduced into the resin, as is common in the art. Such resins include, for example, those functionalized with amino, alkylhalo, formyl or hydroxy 25 groups. Such resins which can serve as solid supports are well known in the art and include, for example, 4-methylbenzhydrylamine-copoly(styrene-1% divinylbenzene) (MBHA), 4-hydroxymethylphenoxyethyl-copoly(styrene-1% divinylbenzene), 4-oxymethyl-phenyl-acetamido- 30 copoly(styrene-1% divinylbenzene) (Wang), 4-(oxymethyl)- phenylacetamido methyl (Pam), and TentagelTM, from Rapp Polymere GmbH, trialkoxy-diphenyl-methyl ester- copoly(styrene-1% divinylbenzene) (RINK) all of which are

commercially available. Other functionalized resins are known in the art and can be used without departure from the scope of the current invention. Such resins may include those described in Jung, G., *Combinatorial Peptide and Nonpeptide Libraries, A Handbook* (VCH Verlag, 1996) or Bunin, B. A., *The Combinatorial Index* (Academic Press, 1998) and are incorporated herein by reference.

As used herein, a "combinatorial library" is an intentionally created collection of differing molecules which can be prepared by the means provided below or otherwise and screened for biological activity in a variety of formats (e.g., libraries of soluble molecules, libraries of compounds attached to resin beads, silica chips or other solid supports). A "combinatorial library," as defined above, involves successive rounds of chemical syntheses based on a common starting structure. The combinatorial libraries can be screened in any variety of assays, such as those detailed below as well as others useful for assessing their biological activity. The combinatorial libraries will generally have at least one active compound and are generally prepared such that the compounds are in equimolar quantities.

Compounds disclosed in previous work that are not disclosed as part of a collection of compounds or not disclosed as intended for use as part of such a collection are not part of a "combinatorial library" of the invention. In addition, compounds that are in an unintentional or undesired mixture are not part of a "combinatorial library" of the invention.

A combinatorial library of the invention can contain two or more of the above-described compounds.

The invention further provides a combinatorial library containing three, four or five or more of the above-described compounds. In another embodiment of the invention, a combinatorial library can contain ten or 5 more of the above-described compounds. In yet another embodiment of the invention, a combinatorial library can contain fifty or more of the above-described compounds. If desired, a combinatorial library of the invention can contain 100,000 or more, or even 1,000,000 or more, of 10 the above-described compounds.

By way of example, the preparation of the combinatorial libraries can use the "split resin approach." The split resin approach is described by, for example, U.S. Patent 5,010,175 to Rutter, WO PCT 91/19735 15 to Simon, and Gallop et al., *J. Med. Chem.*, 37:1233-1251 (1994), all of which are incorporated herein by reference.

The amino acids are indicated herein by either their full name or by the commonly known three letter 20 code. Further, in the naming of amino acids, "D-" designates an amino acid having the "D" configuration, as opposed to the naturally occurring L-amino acids. Where no specific configuration is indicated, one skilled in the art would understand the amino acid to be an L-amino 25 acid. The amino acids can, however, also be in racemic mixtures of the D- and L-configuration or the D-amino acid can readily be substituted for that in the L-configuration.

For preparing pharmaceutical compositions 30 containing compounds of the invention, inert, pharmaceutically acceptable carriers are used. The

pharmaceutical carrier can be either solid or liquid. Solid form preparations include, for example, powders, tablets, dispersible granules, capsules, cachets, and suppositories.

5 A solid carrier can be one or more substances which can also act as diluents, flavoring agents, solubilizers, lubricants, suspending agents, binders, or tablet disintegrating agents; it can also be an encapsulating material.

10 In powders, the carrier is generally a finely divided solid which is in a mixture with the finely divided active component. In tablets, the active compound is mixed with the carrier having the necessary binding properties in suitable proportions and compacted 15 in the shape and size desired.

 For preparing pharmaceutical composition in the form of suppositories, a low-melting wax such as a mixture of fatty acid glycerides and cocoa butter is first melted and the active ingredient is dispersed 20 therein by, for example, stirring. The molten homogeneous mixture is then poured into convenient-sized molds and allowed to cool and solidify.

 Powders and tablets preferably contain between about 5% to about 70% by weight of the active ingredient. 25 Suitable carriers include, for example, magnesium carbonate, magnesium stearate, talc, lactose, sugar, pectin, dextrin, starch, tragacanth, methyl cellulose, sodium carboxymethyl cellulose, a low-melting wax, cocoa butter and the like.

The pharmaceutical compositions can include the formulation of the active compound with encapsulating material as a carrier providing a capsule in which the active component (with or without other carriers) is 5 surrounded by a carrier, which is thus in association with it. In a similar manner, cachets are also included. Tablets, powders, cachets, and capsules can be used as solid dosage forms suitable for oral administration.

Liquid pharmaceutical compositions include, for 10 example, solutions suitable for oral or parenteral administration, or suspensions, and emulsions suitable for oral administration. Sterile water solutions of the active component or sterile solutions of the active component in solvents comprising water, ethanol, or 15 propylene glycol are examples of liquid compositions suitable for parenteral administration.

Sterile solutions can be prepared by dissolving the active component in the desired solvent system, and then passing the resulting solution through a membrane 20 filter to sterilize it or, alternatively, by dissolving the sterile compound in a previously sterilized solvent under sterile conditions.

Aqueous solutions for oral administration can be prepared by dissolving the active compound in water 25 and adding suitable flavorants, coloring agents, stabilizers, and thickening agents as desired. Aqueous suspensions for oral use can be made by dispersing the finely divided active component in water together with a viscous material such as natural or synthetic gums, 30 resins, methyl cellulose, sodium carboxymethyl cellulose,

and other suspending agents known to the pharmaceutical formulation art.

Preferably, the pharmaceutical composition is in unit dosage form. In such form, the composition is 5 divided into unit doses containing appropriate quantities of the active benzimidazole compound. The unit dosage form can be a packaged preparation, the package containing discrete quantities of the preparation, for example, packeted tablets, capsules, and powders in vials 10 or ampules. The unit dosage form can also be a capsule, cachet, or tablet itself, or it can be the appropriate number of any of these packaged forms.

As pharmaceutical compositions for treating infections, pain, or any other indication the compounds 15 of the present invention are generally in a pharmaceutical composition so as to be administered to a subject at dosage levels of from 0.7 to 7000 mg per day, and preferably 1 to 500 mg per day, for a normal human adult of approximately 70 kg of body weight, this 20 translates into a dosage of from 0.01 to 100 mg/kg of body weight per day. The specific dosages employed, however, can be varied depending upon the requirements of the patient, the severity of the condition being treated, and the activity of the compound being employed. The 25 determination of optimum dosages for a particular situation is within the skill of the art.

The compounds and combinatorial libraries of the invention can be prepared as set forth in Figure 1 and as described below.

Variant benzimidazole derivative compounds and combinatorial libraries can be prepared in order to achieve a high level of diversity. For instance, an N-protected amino acid can be coupled to an amine 5 compound and then deprotected, resulting in a carboxamido substituted amino compound having a substituent of the formula -NH-C(O)-variable group-NH₂. Alternatively, a diamine containing a variable group can be coupled to an amine compound in the presence of carbonyldiimidazole 10 (CDI), resulting in an ureido substituted amino compound having a substituent of the formula -NH-C(O)-NH-variable group-NH₂.

The amine compound can be attached to solid support, such as a functionalized resin (e.g., 15 methylbenzhydrylamine (MBHA). Alternatively, a Merrifield resin can be coupled with a primary amine, resulting in the resin attached to a substituent of the formula -HN-variable group. Subsequently, the substituent can be coupled with an amino acid resulting 20 in a group of the formula -HN-variable group-C(O)-variable group.

The carboxamido substituted amino compound can then be coupled to a phenyl compound with a nitro and a halo group at ortho positions, resulting in a phenyl 25 compound substituted with a nitro group and an ortho-monosubstituted amino group. The phenyl compound being coupled can also have one to four additional substituents, such as carboxyl, halo, alkyl, etc. (see Figure 1).

30 Where the phenyl compound also has a carboxyl substituent, this substituent can be reacted with a (i)

monosubstituted amine; (ii) disubstituted amine; (iii) cyclic imide; or (iv) alcohol; resulting, respectively, in a (i) monosubstituted carboxamido substituent; (ii) disubstituted carboxamido substituent; (iii) cyclic imido carbonyl substituent; or (iv) ester substituent attached to the phenyl compound (see Figure 1). It should be understood that such a substituent can be at any one to four of the available positions on the phenyl ring.

10 The nitro group of the phenyl compound can be reduced. The resulting compound can be coupled with an aldehyde compound and cleaved (see Figure 1).

15 In addition, after cleaving, the amino group can be substituted. For example, the amino group can be alkylated with an alkyl halide or substituted alkyl halide.

20 Resin-bound benzimidazole derivative compounds can be cleaved by treating them, for example, with HF gas. The compounds can be extracted from the spent resin, for example, with AcOH (see Figure 1).

Benzimidazole derivative compounds and libraries, such as those of the present invention, can be made utilizing individual polyethylene bags, referred to 25 as "tea bags" (see Houghten et al., *Proc. Natl. Acad. Sci. USA* 82: 5131 (1985); *Biochemistry*, 32:11035 (1993); and U.S. Patent No. 4,631,211, all of which are incorporated herein by reference).

30 The nonsupport-bound combinatorial libraries can be screened as single compounds. In addition, the

nonsupport-bound combinatorial libraries can be screened as mixtures in solution in assays such as radio-receptor inhibition assays, anti-bacterial assays, anti-fungal assays, calmodulin-dependent phosphodiesterase (CaMPDE) assays and phosphodiesterase (PDE) assays, as described in detail below. Deconvolution of highly active mixtures can then be carried out by iterative or positional scanning methods. These techniques, the iterative approach or the positional scanning approach, can be utilized for finding other active compounds within the combinatorial libraries of the present invention using any one of the below-described assays or others well known in the art.

The iterative approach is well-known and is set forth in general in Houghten *et al.*, *Nature*, 354, 84-86 (1991) and Dooley *et al.*, *Science*, 266, 2019-2022 (1994), both of which are incorporated herein by reference. In the iterative approach, for example, sub-libraries of a molecule having three variable groups are made wherein the first variable is defined. Each of the compounds with the defined variable group is reacted with all of the other possibilities at the other two variable groups. These sub-libraries are each tested to define the identity of the second variable in the sub-library having the highest activity in the screen of choice. A new sub-library with the first two variable positions defined is reacted again with all the other possibilities at the remaining undefined variable position. As before, the identity of the third variable position in the sub-library having the highest activity is determined. If more variables exist, this process is repeated for all variables, yielding the compound with each variable contributing to the highest desired activity in the

screening process. Promising compounds from this process can then be synthesized on larger scale in traditional single-compound synthetic methods for further biological investigation.

5 The positional-scanning approach has been described for various combinatorial libraries as described, for example, in R. Houghten et al. PCT/US91/08694 and U.S. Patent 5,556,762, both of which are incorporated herein by reference. In the positional 10 scanning approach, sublibraries are made defining only one variable with each set of sublibraries and all possible sublibraries with each single variable defined (and all other possibilities at all of the other variable positions), made and tested. From the instant 15 description one skilled in the art could synthesize combinatorial libraries wherein two fixed positions are defined at a time. From the testing of each single-variable defined combinatorial library, the optimum substituent at that position can be determined, pointing 20 to the optimum or at least a series of compounds having a maximum of the desired biological activity. Thus, the number of sublibraries for compounds with a single position defined will be the number of different substituents desired at that position, and the number of 25 all the compounds in each sublibrary will be the product of the number of substituents at each of the other variables.

Individual compounds and pharmaceutical compositions containing the compounds, as well as methods 30 of using the same, are included within the scope of the present invention. The compounds of the present invention can be used for a variety of purposes and

indications and as medicaments for any such purposes and indications. For example, benzimidazole derivative compounds of the present invention can be used as pesticides, acaricides, receptor agonists or antagonists 5 and antimicrobial agents, including antibacterial or antiviral agents. The libraries can be screened in any variety of melanocortin receptor and related activity assays, such as those detailed below as well as others known in the art. Additionally, the subject compounds 10 can be useful as analgesics. Assays which can be used to test the biological activity of the instant compounds include antimicrobial assays, a competitive enzyme-linked immunoabsorbent assay and radio-receptor assays, as described below.

15 The melanocortin (MC) receptors are a group of cell surface proteins that mediate a variety of physiological effects, including regulation of adrenal gland function such as production of the glucocorticoids cortisol and aldosterone; control of melanocyte growth 20 and pigment production; thermoregulation; immunomodulation; and analgesia. Five distinct MC receptors have been cloned and are expressed in a variety of tissues, including melanocytes, adrenal cortex, brain, gut, placenta, skeletal muscle, lung, 25 spleen, thymus, bone marrow, pituitary, gonads and adipose tissue (Tatro, Neuroimmunomodulation 3:259-284 (1996)). Three MC receptors, MCR-1, MCR-3 and MCR-4, are expressed in brain tissue (Xia et al., Neuroreport 6:2193-2196 (1995)).

30 A variety of ligands termed melanocortins function as agonists that stimulate the activity of MC receptors. The melanocortins include

melanocyte-stimulating hormones (MSH) such as α -MSH, β -MSH and γ -MSH, as well as adrenocorticotropic hormone (ACTH). Individual ligands can bind to multiple MC receptors with differing relative affinities. The 5 variety of ligands and MC receptors with differential tissue-specific expression likely provides the molecular basis for the diverse physiological effects of melanocortins and MC receptors. For example, α -MSH antagonizes the actions of immunological substances such 10 as cytokines and acts to modulate fever, inflammation and immune responses (Catania and Lipton, Annals N. Y. Acad. Sci. 680:412-423 (1993)).

The role of certain specific MC receptors in some of the physiological effects described above for MC 15 receptors has been elucidated. For example, MCR-1 is involved in pain and inflammation. MCR-1 mRNA is expressed in neutrophils (Catania et al., Peptides 17:675-679 (1996)). The anti-inflammatory agent α -MSH was found to inhibit migration of neutrophils. Thus, the 20 presence of MCR-1 in neutrophils correlates with the anti-inflammatory activity of α -MSH.

An interesting link of MC receptors to regulation of food intake and obesity has recently been described. The brain MC receptor MCR-4 has been shown to 25 function in the regulation of body weight and food intake. Mice in which MCR-4 has been knocked out exhibit weight gain (Huszar et al., Cell 88:131-141 (1997)). In addition, injection into brain of synthetic peptides that mimic melanocortins and bind to MCR-4 caused suppressed 30 feeding in normal and mutant obese mice (Fan et al., Nature 385:165-168 (1997)). These results indicate that

the brain MC receptor MCR-4 functions in regulating food intake and body weight.

Due to the varied physiological activities of MC receptors, high affinity ligands of MC receptors could 5 be used to exploit the varied physiological responses of MC receptors by functioning as potential therapeutic agents or as lead compounds for the development of therapeutic agents. Furthermore, due to the effect of MC receptors on the activity of various cytokines, high 10 affinity MC receptor ligands could also be used to regulate cytokine activity.

A variety of assays can be used to identify or characterize MC receptor ligands of the invention. For example, the ability of a benzimidazole derivative 15 compound to compete for binding of a known MC receptor ligand can be used to assess the affinity and specificity of a benzimidazole compound for one or more MC receptors. Any MC receptor ligand can be used so long as the ligand can be labeled with a detectable moiety. The 20 detectable moiety can be, for example, a radiolabel, fluorescent label or chromophore, or any detectable functional moiety so long as the MC receptor ligand exhibits specific MC receptor binding. A particularly useful detectable MC receptor ligand for identifying and 25 characterizing other MC receptor ligands is ^{125}I -HP 467, which has the amino acid sequence Ac-Nle-Gln-His-(*p*(I)-D-Phe)-Arg-(D-Trp)-Gly-NH₂ and is described in Dooley et al., "Melanocortin Receptor Ligands and Methods of Using Same," U.S. patent application 09/027,108, filed February 30, 1998, which is incorporated herein by reference. HP 467 is a *para*-iodinated form of HP 228.

Using assay methods such as those described above, binding kinetics and competition with radiolabeled HP 467 can confirm that benzimidazole compounds of the invention bind to one or more MC receptors. Furthermore, 5 benzimidazole derivative compounds of the invention can exhibit a range of affinities and specificity for various MC receptors.

The invention provides MC receptor ligands that can bind to several MC receptors with similar affinity. 10 In addition, the invention also provides MC receptor ligands that can be selective for one or more MC receptors. As used herein, the term "selective" means that the affinity of a MC receptor ligand differs between one MC receptor and another by about 10-fold, generally 15 about 20- to 50-fold, and particularly about 100-fold. In some cases, a MC receptor ligand having broad specificity is desired. In other cases, it is desirable to use MC receptor ligands having selectivity for a particular MC receptor. For example, MCR-1 ligands are 20 particularly useful for treating pain and inflammation, whereas MCR-4 ligands are useful for treating obesity. The binding characteristics and specificity of a given MC receptor ligand can be selected based on the particular disease or physiological effect that is desired to be 25 altered.

Another assay useful for identifying or characterizing MC receptor ligands measures signaling of MC receptors. MC receptors are G protein-coupled receptors that couple to adenylate cyclase and produce 30 cAMP. Therefore, measuring cAMP production in a cell expressing a MC receptor and treated with a MC receptor

ligand can be used to assess the function of the MC receptor ligand in activating a MC receptor.

Ligands for MC-3 that can alter the activity of an MC-3 receptor can be useful for treating sexual dysfunction and other conditions or conditions associated with MC-3 such as inflammation. Other MC-3-associated conditions that can be treated with the MC-3 receptor ligands include disuse deconditioning; organ damage such as organ transplantation or ischemic injury; adverse reactions associated with cancer chemotherapy; diseases such as atherosclerosis that are mediated by free radicals and nitric oxide action; bacterial endotoxic sepsis and related shock; adult respiratory distress syndrome; and autoimmune or other patho-immunogenic diseases or reactions such as allergic reactions or anaphylaxis, rheumatoid arthritis, inflammatory bowel disease, ulcerative colitis, glomerulonephritis, systemic lupus erythematosus, transplant atherosclerosis and parasitic mediated immune dysfunctions such as Chagas's Disease.

The invention further provides a method for treating an MC-3-associated condition in a subject. The term "MC-3-associated condition" includes any condition or condition mediated by MC-3 or can be affected by binding an MC-3 ligand. Such conditions include inflammation and sexual dysfunction.

The term "sexual dysfunction" herein means any condition that inhibits or impairs normal sexual function, including coitus. However, the term need not be limited to physiological conditions, but may include

psychogenic conditions or perceived impairment without a formal diagnosis of pathology.

In males, sexual dysfunction includes erectile dysfunction. The term "erectile dysfunction" or 5 "impotence" means herein the inability or impaired ability to attain or sustain an erection that would be of satisfactory rigidity for coitus. Sexual dysfunction in males can also include premature ejaculation and priapism, which is a condition of prolonged and sometimes 10 painful erection unrelated to sexual activity, often associated with sickle-cell disease.

In females, sexual dysfunction includes sexual arousal disorder. The term "sexual arousal disorder" means herein a persistent or recurrent failure to attain 15 or maintain the lubrication-swelling response of sexual excitement until completion of sexual activity. Sexual dysfunction in females can also include inhibited orgasm and dyspareunia, which is painful or difficult coitus. Sexual dysfunction can also be manifested as inhibited 20 sexual desire or inhibited lordosis behavior in animals.

In addition, the ability of the compounds to inhibit bacterial growth, and therefore be useful to that infection, can be determined by methods well known in the art. Compounds of the present invention were shown to 25 have antimicrobial activity by the *in vitro* antimicrobial activity assay described below and, therefore, are useful as antimicrobial agents (see Example 16).

In addition, an exemplary *in vitro* antimicrobial activity assay is described in Blondelle 30 and Houghten, *Biochemistry* 30:4671-4678 (1991), which is

incorporated herein by reference. In brief, *Staphylococcus aureus* ATCC 29213 (Rockville, MD) is grown overnight at 37°C in Mueller-Hinton broth, then re-inoculated and incubated at 37°C to reach the exponential 5 phase of bacterial growth (i.e., a final bacterial suspension containing 10^5 to 5×10^5 colony-forming units/ml). The concentration of cells is established by plating 100 μ l of the culture solution using serial dilutions (e.g., 10^{-2} , 10^{-3} and 10^{-4}) onto solid agar 10 plates. In 96-well tissue culture plates, compounds, individual or in mixtures, are added to the bacterial suspension at concentrations derived from serial two-fold dilutions ranging from 1500 to 2.9 μ g/ml. The plates are incubated overnight at 37°C and the growth determined at 15 each concentration by OD_{620} nm. The IC_{50} (the concentration necessary to inhibit 50% of the growth of the bacteria) can then be calculated.

The competitive ELISA method which can be used here is a modification of the direct ELISA technique 20 described previously in Appel et al., J. Immunol. 144:976-983 (1990), which is incorporated herein by reference. It differs only in the MAb addition step. Briefly, multi-well microplates are coated with the antigenic peptide (Ac-GASPYPNLSNQQT-NH₂) at a 25 concentration of 100 pmol/50 μ l. After blocking, 25 μ l of a 1.0 mg/ml solution of each mixture of a synthetic combinatorial library (or individual compound) is added, followed by MAb 125-10F3 (Appel et al., *supra*) (25 μ l per well). The MAb is added at a fixed dilution in which the 30 bicyclic guanidine in solution effectively competes for MAb binding with the antigenic peptide adsorbed to the plate. The remaining steps are the same as for direct ELISA. The concentration of compound necessary to

inhibit 50% of the MAb binding to the control peptide on the plate (IC_{50}) is determined by serial dilutions of the compound.

Alternative screening can be done with radio-
5 receptor assays. The radio-receptor assay, can be selective for any one of the μ , κ , or δ opiate receptors. Compounds of the present invention can be useful *in vitro* for the diagnosis of relevant opioid receptor subtypes, such as κ , in the brain and other tissue samples.
10 Similarly, the compounds can be used *in vivo* diagnostically to localize opioid receptor subtypes.

The radio-receptor assays are also an indication of the compounds' analgesic properties as described, for example, in Dooley et al., *Proc. Natl. Acad. Sci.*, 90:10811-10815 (1993). For example, it can be envisioned that these compounds can be used for therapeutic purposes to block the peripheral effects of a centrally acting pain killer. For instance, morphine is a centrally acting pain killer. Morphine, however, has a number of deleterious effects in the periphery which are not required for the desired analgesic effects, such as constipation and pruritus (itching). While it is known that the many compounds do not readily cross the blood-brain barrier and, therefore, elicit no central effect, the subject compounds can have value in blocking the periphery effects of morphine, such as constipation and pruritus. Accordingly, the subject compounds can also be useful as drugs, namely as analgesics, or to treat pathologies associated with other compounds which interact with the opioid receptor system.

Additionally, such compounds can be tested in a σ receptor assay. Ligands for the σ receptor can be useful as antipsychotic agents, as described in Abou-Gharbia et al., *Annual Reports in Medicinal Chemistry*, 5 28:1-10 (1993).

Radio-receptor assays can be performed with particulate membranes prepared using a modification of the method described in Pasternak et al., *Mol. Pharmacol.* 11:340-351 (1975), which is incorporated herein by reference. Rat brains frozen in liquid nitrogen can be obtained from Rockland (Gilbertsville, PA). The brains are thawed, the cerebella removed and the remaining tissue weighed. Each brain is individually homogenized in 40 ml Tris-HCl buffer (50 mM, pH 7.4, 4°C) and centrifuged (Sorvall[®] RC5C SA-600: Du Pont, Wilmington, DE) (16,000 rpm) for 10 minutes. The pellets are resuspended in fresh Tris-HCl buffer and incubated at 37°C for 40 minutes. Following incubation, the suspensions are centrifuged as before, the resulting pellets resuspended in 100 volumes of Tris buffer and the suspensions combined. Membrane suspensions are prepared and used in the same day. Protein content of the crude homogenates generally range from 0.15-0.2 mg/ml as determined using the method described in Bradford, M.M., *Anal. Biochem.* 72:248-254 (1976), which is incorporated herein by reference.

Binding assays are carried out in polypropylene tubes, each tube containing 0.5 ml of membrane suspension. 8 nM of 3 H-[D-Ala², Me-Phe⁴, Gly-ol⁵]enkephalin (DAMGO) (specific activity = 36 Ci/mmol, 160,000 cpm per tube; which can be obtained from Multiple Peptide Systems, San Diego, CA, through NIDA drug distribution

program 271-90-7302) and 80 μ g/ml of bicyclic guanidine, individual or as a mixture and Tris-HCl buffer in a total volume of 0.65 ml. Assay tubes are incubated for 60 mins. at 25°C. The reaction is terminated by filtration 5 through GF-B filters on a Tomtec harvester (Orange, CT). The filters are subsequently washed with 6 ml of Tris-HCl buffer, 4°C. Bound radioactivity is counted on a Pharmacia Biotech Betaplate Liquid Scintillation Counter (Piscataway, NJ) and expressed in cpm. To determine 10 inter- and intra-assay variation, standard curves in which 3 H-DAMGO is incubated in the presence of a range of concentrations of unlabeled DAMGO (0.13-3900 nM) are generally included in each plate of each assay (a 96-well format). Competitive inhibition assays are performed as 15 above using serial dilutions of the bicyclic guanidines, individually or in mixtures. IC_{50} values (the concentration necessary to inhibit 50% of 3 H-DAMGO binding) are then calculated. IC_{50} values of less than 1000 nM are indicative of highly active opioid compounds 20 which bind to the μ receptor, with particularly active compounds having IC_{50} values of 100 nM or less and the most active compounds with values of less than 10 nM.

As opposed to this μ receptor selective assay, which can be carried out using 3 H-DAMGO as radioligand, as 25 described above, assays selective for κ receptors can be carried out using [3 H]-U69,593 (3 nM, specific activity 62 Ci/mmol) as radioligand. Assays selective for δ opiate receptors can be carried out using tritiated DSLET ([D-Ser², D-Leu⁵]-threonine-enkephalin) as radioligand. 30 Assays selective for the σ opiate receptor can use radiolabeled pentazocine as ligand.

Screening of combinatorial libraries and compounds of the invention can be done with an anti-fungal assay. Compounds of the present invention can be useful for treating fungal infections.

5 Screening of combinatorial libraries and compounds of the invention also can be done with a calmodulin-dependent phosphodiesterase (CaMPDE) assay. Compounds of the present invention can be useful as calmodulin antagonists.

10 Calmodulin (CaM), which is the major intracellular calcium receptor, is involved in many processes that are crucial to cellular viability. In particular, calmodulin is implicated in calcium-stimulated cell proliferation. Calmodulin antagonists 15 are, therefore, useful for treating conditions associated with increased cell proliferation, for example, cancer. In addition, calmodulin antagonists such as compounds of the subject invention are useful both in vitro and in vivo for identifying the role of calmodulin in other 20 biological processes. The disadvantages of known antagonists such as trifluoperazine and N-(4-aminobutyl)-5-chloro-2-naphthalenesulfonamide (W13) include their non-specificity and toxicity. In contrast, advantages of the combinatorial libraries and compounds of the subject 25 invention as calmodulin antagonists include their reduced flexibility and ability to generate broader conformational space of interactive residues as compared to their linear counterparts.

30 An example of an assay that identifies CaM antagonists is a CaMPDE assay. In brief, samples are mixed with 50 μ l of assay buffer (360 mM Tris, 360 mM

Imidazole, 45 mM Mg(CH₃COO)₂, pH 7.5) and 10 μ l of CaCl₂ (4.5 mM) to a final volume of 251 μ l. 25 μ l of calmodulin stock solution (Boehringer Mannheim; 0.01 μ g/ μ l) is then added and the samples then sit at room temperature for 10 minutes. 14 μ l of PDE (Sigma; 2 Units dissolved in 4 ml of water; stock concentration: 0.0005 Units/ μ l) is then added, followed by 50 μ l of 5'-nucleotidase (Sigma; 100 Units dissolved in 10 ml of 10 mM Tris-HCl containing 0.5 mM Mg(CH₃COO)₂, pH 7.0; stock concentration: 10 Units/ml). The samples are then incubated for 10 minutes at 30°C. 50 μ l of adenosine 3',5'-cyclic monophosphate (cAMP) (20 mM in water at pH 7.0) is added, the samples incubated for 1 hour at 30°C and then vortexed. 200 μ l of trichloroacetic acid (TCA) (55% in water) is added to a 200 μ l sample aliquot, which is then vortexed and centrifuged for 10 minutes. 80 μ l of the resulting supernatants of each sample is transferred to a 96-well plate, with 2 wells each containing 80 μ l of each sample. 80 μ l of ammonium molybdate (1.1% in 1.1N H₂SO₄) is then added to all the wells, and the OD of each were determined at 730nm, with the values later subtracted to the final OD reading. 16 μ l of reducing agent (6g sodium bisulfite, 0.6g sodium sulfite and 125mg of 1-amino-2-naphtol-4-sulfonic acid in 50ml of water) is then added to one of each sample duplicate and 16 μ l of water is added to the other duplicate. After sitting for 1 hour at room temperature, the OD of each well is determined at 730nm. The percent inhibition of calmodulin activity is then calculated for each sample, using as 0% inhibition a control sample containing all reagents without any test samples and as 100% inhibition a control sample containing test samples and all reagents except calmodulin. In addition, the percent inhibition of phosphodiesterase activity was

determined by following a similar protocol as the CaMPDE assay described above, except not adding calmodulin to the sample mixture and calculating the percent inhibition by using as 0% inhibition a control reagent without any 5 test samples and as 100% inhibition a control sample containing test samples and all reagents except cAMP.

10 **1. Coupling of N-protected amino acid to MBHA resin**

1.0 g of MBHA resin (1.3 meq/g) was placed in a porous polypropylene packet (Tea-bag, 60mm x 60mm, 65μ). The packet was washed with 5% DIEA/DCM (2 X 60 mL) in a 125 mL plastic bottle. DMF (80 mL), 15 Boc-phenylalanine (4.24g, 16 mmol), DIC (3.03g, 24 mmol), HOBt (2.16g, 16 mmol) were added sequentially. After shaking for 24 hours, the packet was washed alternately with DMF (80 mL) and MeOH (80 mL) for 3 cycles followed by DCM (80 mL) and MeOH (80 mL). The packet was dried in 20 air for 2 hours. The packet was shaken with 55% TFA/DCM (80 mL) at room temperature for 40 minutes and washed with DCM (3 X 80 mL), 5% DIEA/DCM (2 X 80 mL) and MeOH (80 mL).

2. N-Arylation with 4-fluoro-3-nitrobenzoic acid.

25 The packet was heated in a solution of 4-fluoro-3-nitrobenzoic acid (2.96g, 16 mmol) and DIEA (2.02g, 16 mmol) in N-methylpyrrolidinone (80 mL) at 70° C for 24 hours. The packet was washed alternately with DMF (80 mL) and MeOH (80 mL) for 3 cycles followed

The packet was washed alternately with DMF (80 mL) and MeOH (80 mL) for 3 cycles followed by DCM (80 mL) and MeOH (80 mL). The packet was dried in air overnight.

4. Reduction of the nitro group to amine.

20 The packet was cut open and the resin was suspended in N-methylpyrrolidinone (30 mL). The suspension was distributed equally into 68 wells of a microtiter plate (2mL X 96). N-Methylpyrrolidinone (240 μ L), acetic acid (185 μ L) and a solution of 25 corresponding aldehyde (see list below) in N-methylpyrrolidinone (100 μ L X 1.0 M) were added to each well. The plate was tightly capped, shaken and incubated at 67° C for 48 hours. The resin was washed alternately with DMF (3 X 1 mL/well) and MeOH (2 X 1 mL/well),

DCM/t-BuOMe (50%, 2 X 1 mL/well) and MeOH (2 X 1 mL/well). The plate was dried in air overnight and under vacuum for 4 hours. The plate was treated with gaseous HF at room temperature for 2 hours. Melanocortin Receptor Assay

This example describes methods for assaying binding to MC receptors.

25 All cell culture media and reagents were obtained from GibcoBRL (Gaithersburg MD), except for COSMIC CALF SERUM (HyClone; Logan UT). HEK 293 cell lines were transfected with the human MC receptors hMCR-1, hMCR-3, and hMCR-4 (Gantz et al., Biochem. Biophys. Res. Comm. 200:1214-1220 (1994); Gantz et al., J. Biol.

Chem. 268:8246-8250 (1993); Gantz et al. J. Biol. Chem. 268:15174-15179 (1993); Haskell-Leuvano et al., Biochem. Biophys. Res. Comm. 204:1137-1142 (1994); each of which is incorporated herein by reference). Vectors for 5 construction of an hMCR-5 expressing cell line were obtained, and a line of HEK 293 cells expressing hMCR-5 was constructed (Gantz, *supra*, 1994). hMCR-5 has been described previously (Franberg et al., Biochem. Biophys. Res. Commun. 236:489-492 (1997); Chowdhary et al., 10 Cytogenet. Cell Genet. 68:1-2 (1995); Chowdhary et al., Cytogenet. Cell Genet. 68:79-81 (1995), each of which is incorporated herein by reference). HEK 293 cells were maintained in DMEM, 25 mM HEPES, 2 mM glutamine, non-essential amino acids, vitamins, sodium pyruvate, 15 10% COSMIC CALF SERUM, 100 units/ml penicillin, 100 µg/ml streptomycin and 0.2 mg/ml G418 to maintain selection.

Before assaying, cells were washed once with phosphate buffered saline ("PBS"; without Ca^{2+} and Mg^{2+}), and stripped from the flasks using 0.25% trypsin and 20 0.5 mM EDTA. Cells were suspended in PBS, 10% COSMIC CALF SERUM and 1 mM CaCl_2 . Cell suspensions were prepared at a density of 2×10^4 cells/ml for HEK 293 cells expressing hMCR-3, hMCR-4 or hMCR-5, and 1×10^5 cells/ml for HEK 293 cells expressing hMCR-1. Suspensions were 25 placed in a water bath and allowed to warm to 37°C for 1 hr.

Binding assays were performed in a total volume of 250 µl for HEK 293 cells. Control and test compounds were dissolved in distilled water. ^{125}I -HP 467 30 (50,000 dpm) (2000 Ci/mmol) (custom labeled by Amersham; Arlington Heights IL) was prepared in 50 mM Tris, pH 7.4, 2 mg/ml BSA, 10 mM CaCl_2 , 5 mM MgCl_2 , 2 mM EDTA and added

to each tube. To each tube was added 4×10^3 HEK 293 cells expressing hMCR-3, hMCR-4 or hMCR-5, or 2×10^4 cells expressing hMCR-1. Assays were incubated for 2.5 hr at 37°C.

5 GF/B filter plates were prepared by soaking for at least one hour in 5 mg/ml BSA and 10 mM CaCl₂. Assays were filtered using a Brandel 96-well cell harvester (Brandel Inc.; Gaithersburg, MD). The filters were washed four times with cold 50 mM Tris, pH 7.4, the 10 filter plates were dehydrated for 2 hr and 35 μ l of MICROSCINT was added to each well. Filter plates were counted using a Packard Topcount (Packard Instrument Co.) and data analyzed using GraphPad PRISM v2.0 (GraphPad Software Inc.; San Diego CA) and Microsoft EXCEL v5.0a 15 (Microsoft Corp.; Redmond WA).

To assay benzimidazole derivative compounds, binding assays were performed in duplicate in a 96 well format. HP 467 was prepared in 50 mM Tris, pH 7.4, and ¹²⁵I-HP 467 was diluted to give 100,000 dpm per 50 μ l. A 20 benzimidazole derivative compound, synthesized as described in Examples 1 to 5, was added to the well in 25 μ l aliquots. A 25 μ l aliquot of ¹²⁵I-HP 467 was added to each well. A 0.2 ml aliquot of suspended cells was added to each well to give the cell numbers indicate 25 above, and the cells were incubated at 37°C for 2.5 hr. Cells were harvested on GF/B filter plates as described above and counted.

EXAMPLE 8

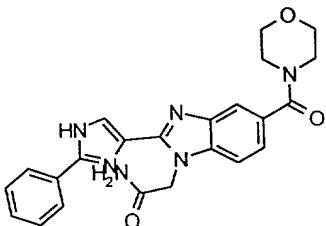

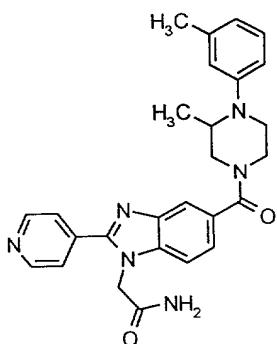

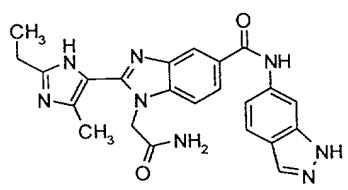

Anti-microbial Screen

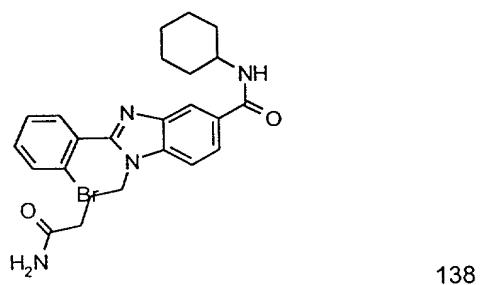

Streptococcus pyogenes (ATCC# 97-03 14289) were
5 grown in Todd Hewitt Broth (THB) (Difco Laboratories
#0492-17-6) overnight until they reached an optical
density of (OD = 0.636@ 570 nm) by reading 0.1 ml in a
96 well microtiter plate in a Molecular Devices
Thermomax. This preparation was kept frozen as stocks in
10 30% v/v glycerol in 1.5 ml aliquots at -70 C° until used.
Prior to screening, 1.5 ml aliquots were thawed and
diluted into 50 ml THB. 200 ul of this dilution was
added to 92 wells of microtiter plate. To three wells
THB (200 ul) was added to serve as a blank and a
15 sterility control. Test compounds in DMSO and
appropriate concentrations of DMSO were added to
Growth/Solvent Controls at 0 time. Plates were read at 0
time at 570 nm in the Molecular Devices plate reader to
obtain compounds correction factors for insoluble or
20 colored compounds. Plates were read again at 4 hrs.

Compounds were assayed at a concentration of
170 µg/ml. Percent inhibition for each compound was
calculated using the following formulae:

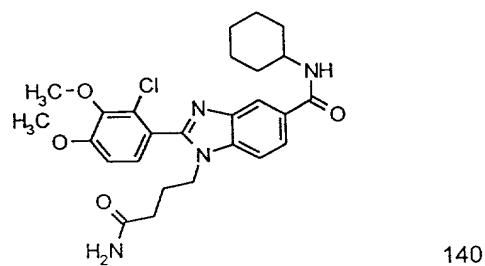

Color correct =
25 (O.D. 0 hr - Blank 0 hr)-(Solvent Control 0 hr - Blank
0 hr)

% Inhibition =
100 - (O.D. test compound 4 hr - Blank 4 hr - color
30 correct) divided by (O.D. growth/solvent control 4 hr -
Blank 4 hr)

Percent inhibition of benzimidazole compounds of the invention are provided in the table below:

EXAMPLE 9

Penile erection due to administration of a benzimidazole derivative compound

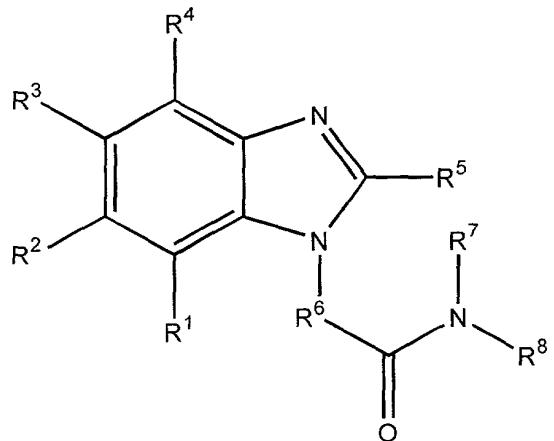

Adult male rats are housed 2-3 per cage and are acclimated to the standard vivarium light cycle (12 hr. light, 12 hr. dark), rat chow and water for a least a week prior to testing. All experiments are performed 10 between 9 a.m. and noon and rats are placed in cylindrical, clear plexiglass chambers during the 60 minute observation period. Mirrors are positioned below and to the sides of the chambers, to improve viewing.

Observations begin 10 minutes after an 15 unstraperitoneal injection of either saline or compound. An observer counts the number of grooming motions, stretches, yawns and penile erections (spontaneously occurring, not elicited by genital grooming) and records them every 5 minutes, for a total of 60 minutes. The 20 observer is unaware of the treatment and animals are tested once, with n=6 in each group. Values in the figures represent the group mean and standard error of the mean. HP 228 can be used as a positive control for penile erections. Significant differences between groups 25 are determined by an overall analysis of variance and the Student Neunmann-Keuls post hoc test can be used to identify individual differences between groups (p ≤ 0.05).

Although the invention has been described with reference to the examples provided above, it should be understood that various modifications can be made by those skilled in the art without departing from the 5 invention. Accordingly, the invention is set out in the following claims.
